Housing Platform

(u n d e r N D A)

BRIEF RECAP

The client wanted to develop a global platform where demand and supply of rooms for international students meet each other.

MAIN CHALLENGES

We developed a mobile-friendly web application which allows either to post your own room as “available” or look for the room listing at your destination point.

Also, we’ve built a custom Admin panel, which provides tools to add rooms to cloud databases and to be synchronized by customer device upon application launch so that users will always see recently added rooms.

SOLUTION

The “Housing Platform” application provides users an easy way to rent the apartment or list their own one as available for staying.

Web application provides users an option to pay for selected listings online via integrated payment services.

Besides, users can check out the list of previously checked rooms and add the preferred ones to personal bookmarks in order to check/book the apartment later.
